

FinTech Project 3 **W**

Modern Distributed Application Development

Building a Web3 application using modern tools & techniques

Team members:

- David Lopez
- Peter Morales
- Jaime Aranda
- Rupika Ranjan Babu
- Shivangi Gupta

Project Overview:

<https://github.com/pmm09c/auction-house>

Created a Marketplace for ERC tokens.

- While learning and building, how to **setup, build, deploy and interact with a web3** application using modern development techniques.
- Using **Solidity, ERC-20, ERC-721, and ERC-1155 contracts** were authored and deployed to the **rinkeby** testnet.
- A **marketplace contract** was further deployed. **Tokens (Fungible and Non Fungible)** were **minted**, and items were **listed for sale** on the marketplace

Technology :

Used to build, deploy, interact

-  **Solidity** For writing Smart Contracts for Minting ERC 20, ERC 721 & ERC 1155 Tokens and Marketplace to List the Tokens
-  **Hardhat** Development environment for compilation, testing, deployment and verifying contracts
-  **Alchemy** For hosting deployed app on testnet
-  **Rinkeby** An ethereum test network
-  **Pinata/NFT.storage** To generate URI for tokens and for hosting images of minted tokens/nfts
-  **React** For authoring Web view/ UI
-  **Typescript** Language for authoring deploy, test, view/interactive scripts
-  **ethers.js** Library for use in scripts/web to interact with contracts programmatically
-  **node.js** Framework for managing local environment, and runtime for typescript/javascript

ERC Standards for Tokens

ERC20 vs. ERC 721 vs. ERC1155

- ERC-20 introduces the token standard for creating fungible tokens on the Ethereum blockchain.
ERC-20 consists of properties that support the development of identical tokens.
- ERC-721 tokens are the standards for non-fungible tokens (NFTs).
- ERC-1155 is a smart contract interface representing fungible, semi-fungible, and non-fungible tokens.
ERC-1155 can perform the function of ERC-20 and ERC-721 and even both simultaneously.

Development Workflow:

Smart contracts authored for Minting tokens (FT & NFTs) with ERC 20, ERC 721 and ERC 1155 standards along with smart contract for Market place using **Solidity(Language)** and **Visual Studio (Editor)**

Design/Build

Contracts compiled, tested and deployed with **hardhat** on **Rinkeby test Network** using **Metamask wallet** and **Alchemy** as a Node provider for listening to on chain events

Compile/Test

NFTs point to data on **IPFS** for images and token metadata offchain. **Pinata** makes it easy to "pin" stored data and information for nft access.

Stage Assets/ Deploy

Alternatively, a webpage in **react** using **ethers.js** and deployed with **node.js** can be used to interact with contract - Mint/Trade/etc

Interact

Contracts are validated on **etherscan** for easy interaction and transparency of the contract

Validate

DEMO

Remaining...?

- Enhancing the auction contract .. fixing bugs
- Building on the UI for a good user experience

THANK YOU
